

Small garden water, slowly

A short observation guide for community learning

FIELD QUESTION

What changes after a light rain?

Follow water from the garden path to one planting bed.

01 Notice the ground

Look for darker soil, shallow channels, and places where water rests. Record what you can see before drawing an explanation.

02 Compare two small areas

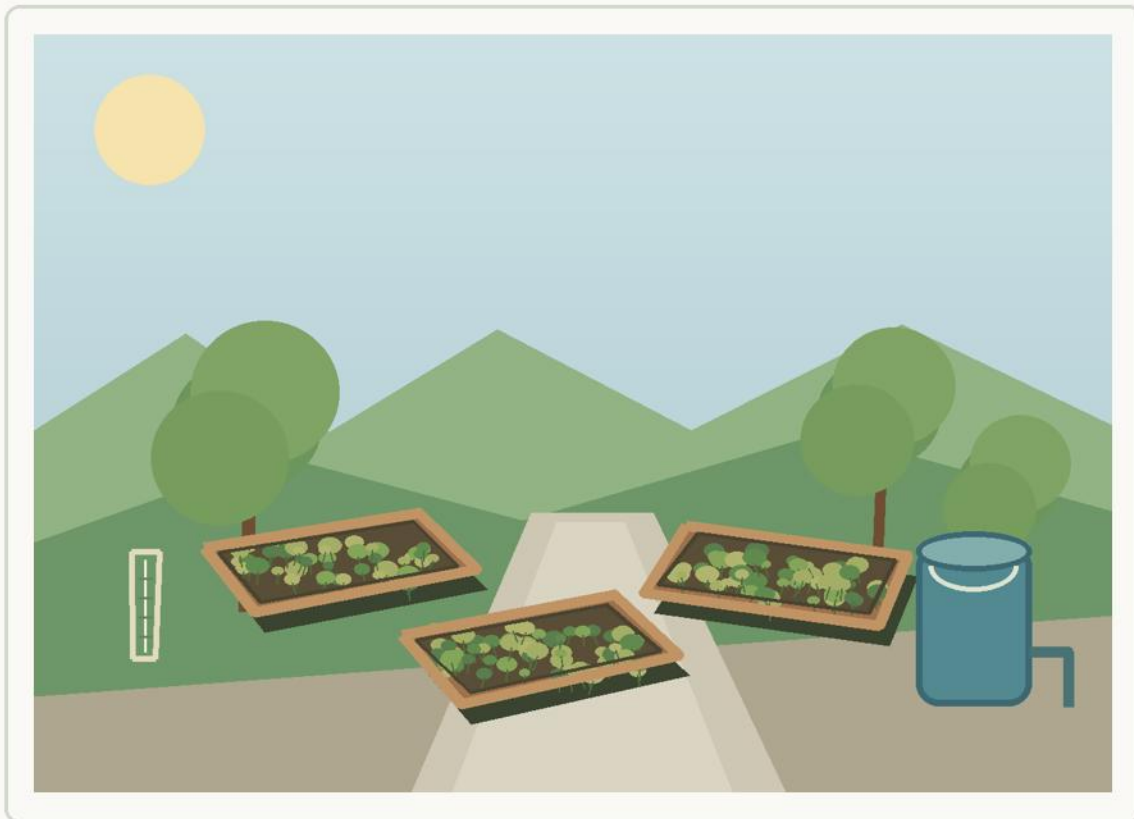

Choose one planted bed and one path edge. Use the same observation interval for both locations.

KEEP THE RECORD

Describe a visible pattern first; mark interpretation separately.

03 Map a simple route

Trace one path with three stops: edge, bed, and barrel.

04 Write what the picture cannot tell you

Note when and where the observation was made. A photograph can show a surface, but not the amount or direction of flow.

SAMPLE RECORD

"The path edge is darker than the bed after the shower."
